z

New Rim 2 proteins and nucleic acids encoding the protein useful in diagnosing endocrine-related diseases or neuropathy and in developing agents for the prevention or treatment of such diseases

Claim 1; Page 10-19; 42pp; English.

This sequence represents mouse Rim2. Rim2 is a novel isoform of Rim (Rab3-interacting molecule, also referred to in the specification as Rim1), and both proteins contain a zinc finger, DZ and two CZ domains. Rim2 is able to specifically interact with the GTF/GDP exchange factor CAMP-GERII, a CAMP sensor molecule, and the GTF/GDP exchange factor CAMP-GERII, a CAMP sensor molecule, and is believed to be a regulator of Rab3-dependent intracellular vesicle fusion in neurons and endocrine tissue. It is therefore likely to play a key role in neurotransmitter release at presynaptic membranes, and in hormonal secretion. The Rim2 procein is useful in diagnosing, and in hormonal secretion. The Rim2 procein is useful in diagnosing the prevention or treatment of such diseases. Rim2-specific hybridisation probes or antibodies are useful in the diagnosis of brain of central nervous system disorders, or for diagnosis of secretion disorders of the prevention and parotid gland, hypothalamus, pancreatic beta-cells and parotid gland.

Modulating the biological function of an endothelial cell or hematopoletic cell e.g., a T-cell or B-cell comprises introducing into the cell, an agent that inhibits binding of a PDZ protein and a PDZ ligand protein in the cell -

Example 3; Page 165; 207pp; English.

function of an endothelial cell or haematopoietic cell. Mi comprises
introducing into the cell, an agent that inhibits binding of a PDZ
(FBSD95, Drosophila large disc protein, and zonnia occludin 1 protein)
protein and a PDZ ligand (PL) protein in the cell, and so modulates the
biological function. Also described is a method (M2) for determining
whether a test compound is an inhibitor of binding between a PDZ protein
and a PL protein. Mi is used for modulating a biological function of an
endothelial cell or haematopoietic cell e.g., T-cell or B-cell, by an
inflammatory or humoral immune response, or an autoimmune disease. An
inhibitor (I) is useful for treating a disease characterised by leukocyte
activation, where the disease is characterised by an inflammatory or
humoral immune response, e.g., an autoimmune disease. The compounds
e.g., PL-PDZ interaction inhibitors are useful for treating (ameliorating
symptoms of) a variety of diseases and conditions characterised by
inflammatory bowel diseases ulcerative colitis, inflammatory and humoral immune responses e.g., inflammatory and memoral immune responses e.g., inflammatory well alleragic chinitis, ileitis and enteritis,
c psoriasis and inflammatory dermatoses e.g., inflammatory and humoral immune responses e.g., inflammatory powel diseases and conditions characterised by
c inflammatory bowel diseases ulcerative colitis, independent diseases, cadaver,
autologous, bone marrow, xenotransplantation, atherosclerosis, cadaver,
autologous, bone marrow, xenotransplantation, atherosclerosis, cancers,
autologous, bone marrow, xenotransplantation, atherosclerosis, cadaver,
autologous, bone marrow, xenotransplantation, atherosclerosis,
c ABB96620 to AB996732 and ABP63153 to ABP65578 represent sequences used The present invention describes a method (M1) for modulating a biological in the exemplification of the present invention.

Fifty nucleic acid molecules encoding human secreted proteins, useful in the prevention, treatment and diagnosis of cancer, immune disorders, cardiovascular disorders and neurological diseases -

Disclosure, Page 419-420; 425pp; English

The polymucleotide sequences given in AAC59966 to AAC60015 encode the human secreted proteins given in AAB34773 to AAB34822. AAB34823 to human secreted proteins given in the sequences and proteins to consider the proteins in the exemplification of the present invention. Human secreted proteins have activities based on the tissues and cells the genes are expressed in. Examples of activities include: cytostatic; immunosuppressive; nootropic; neuroprotective; antiviral; antiallargic; hepatotropic; antidabetic; antifungal, antiparasitic; and cardiant. The polymucleotides and polympetides are useful for cardiant. The polymucleotides and polympetides are useful for preventing, treating or amelorating a medical condition in e.g. humans, once, rabbits, goats, horses, cats, dogs, chickens or Bheep. The polymucleotides are also be used as a food additive or preservative to increase or decrease storage capabilities. The polymucleotides are useful for chromosome identification. They are also useful as probes for diagnosing a disorder related to the female reproductive system, particularly breast and ovary ancer. They are also useful in the gene therapy of breast and ovary and cancer. Nucleic acids, protein, antibodies, candiovascular disorders, wound healing, neurological diseases and continued the account it finetions disease, and the present invention are useful in the continued and prevention of cancer immune disorders. used in the exemplification of the present invention.

New isolated polynucleotides and secreted proteins - obtained from human foetal kidney, adult testes, placenta, adult brain and foetal brain cDNA libraries

This is the amino acid sequence of novel human secreted protefn CO618 1, as predicted from human adult brain cDNA clone CO618 1 (see AN40465). CO618 1 cDNA was isolated using methods which are selective for cDNAs encoding secreted proteins, and was identified as encoding a secreted or transmembrane protein on the basis of as encoding a secreted or transmembrane protein on the basis of computer analysis of the amino acid sequence of the encoded protein. CO618 1 shows some sequence similarity to rat Rim, a protein. CO618 1 shows some sequence similarity to rat Rim, a protein and foetal human foetal proteins (see AAW29636-45) adult brain and foetal brain, and can be obtained by expression in recombinant host cells. The polypeptides may have e.g. mutritional crivity, immunostimulant or immunosuppressive activity, haematopoiesis regulating activity, tissue growth activity, activity, chocking and cell proliferation or differentiation activity, haematopoiesis regulating activity, rissue growth activity, haematopoiesis regulating activity, receptor/ligand activity, antifinammatory activity, canherin or tumour invasion suppressor activity, tumour inhibition activity, or other activities.

```
The polynuclectide sequences given in AAG59966 to AAG60015 encode the human secreted proteins given in AAB34773 to AAB34822. AAB34823 to AAB34822 represent human secreted polypeptide sequences and proteins to man secreted proteins have activities based on the tissues can decila the genes are expressed in Examples of activities in the present invention. Human secreted proteins have activities based on the tissues and cells the genes are expressed in Examples of activities include: cytostatic; immunosuppressive, nootropic; neuroprotective; antividate include: cytostatic; immunosuppressive, nootropic; neuroprotective; antividate cytostatic; immunosuppressive, nootropic; neuroprotective; antividate cytostatic; anticonvulsant; antibacterial; antifungal; antiparasitic; and cardiant. The polynucleotides are useful for cytostating, treating or ameliorating a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. The polynucleotides are useful for chromosome identification. They are also useful as probes for diagnosing a disorder related to the female reproductive system, carciant and ovarian cancer. They are also useful in the gene therapy of breast and ovarian cancer. Nucleic acids, protein, antibodies, agonists and antagonists from the present invention are useful in the cardiovascular disorders, wound healing, neurological diseases and in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL16111), expressed DNA sequences (ABL16176-ABL16111), expressed DNA

Fifty nucleic acid molecules encoding human secreted proteins, useful in the prevention, treatment and diagnosis of cancer, immune disorders, cardiovascular disorders and neurological diseases -

Disclosure; Page 420-421; 425pp; English.

The polymuclectide sequences given in AACS9966 to AAC60015 encode the human secreted proteins given in AAB34773 to AAB34822. AAB34823 to AAB34822 represent human secreted polymeptide sequences and proteins in homologous to them, which are given in the exemplification of the present invention. Human secreted proteins have activities based on the tissues of and cells the genes are expressed in. Examples of activities include: Crostatic, immunosuppressive, nootropic; neuroprotective; antivital; anticornulsant; antibacterial; antifungal; anticornulsant; antibacterial; antifungal; antivites; cardiant. The polymucleotides and polymeptides are useful for cardiant. The polymucleotides and polymeptides can also used needs a food additive or preservative to increase or decrease storage capabilities. The polymucleotides are useful for chromosome identification. They are also useful as probes for increase or decrease storage capabilities. The polymucleotides are useful for chromosome identification. They are also useful in the gene therapy of breast and/or ovary cancer. They are also useful in the gene therapy of breast and/or ovary cancer. They are also useful in the capanists and antagonists from the present invention are useful in the disonders, treatment and prevention of cancer, immune disorders, calling the present invention are useful.

Cardiovascular disorders, wound healing, neurological diseases and infectious diseases. AACS9955 and AACS99 used in the exemplification of the present invention. 88888888888888888888888888

Nucleic acids encoding 3224 human nervous system antigen polypeptides, useful for preventing, diagnosing and/or treating nervous system cancers and metastases -

Claim 11; SEQ ID NO 3746; 1701pp + Sequence Listing; English

```
The invention relates to novel genes (ABA11004-ABA21534) and proteins (ABB14678-ABB18001) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant) agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune charmolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and parasitic infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                 Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

```
The polymuclectide sequences given in AAC59966 to AAC60015 encode the human secreted proteins given in AAB34773 to AAB34822. AAB34823 to human secreted proteins given in AAB34773 to AAB34822. AAB34823 to AAB34822 represent human secreted polymeride sequences and proteins howologous to them, which are given in the exemplification of the present invention. Ruman secreted proteins have activities based on the tissues condected in manneous presents and cells the genes are expressed in. Examples of activities include: cytostatic; immunosuppressive; noctropic; antidabetic; antidalersy; anticonvulsant; antibacterial; antifungal; antiparasitic; and artialersy; anticonvulsant; antibacterial; antifungal; antiparasitic; and cardiant. The polymucleotides are useful for cardiant. The polymucleotides are useful for preventing, treating or ameliorating a medical condition in e.g. humans, condicesse or decrease storage capabilities. The polymucleotides are useful for chromosome identification. They are also useful in the gene conformation and second conformation are useful in the gene conformation and prevention of cancer. Immune disorders, and ovary and cancer. Manued diseases and cancers wound healing, neurological diseases and cancers and in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1446 DKKGQLEVEIIRARGLVVKPGSKTLPAPYVKVYLLDNGVCIAKKKTKVARKTLEPLYQQL 1505

Modulating the biological function of an endothelial cell or hematopoietic cell e.g., a T-cell or B-cell comprises introducing into the cell, an agent that inhibits binding of a PDZ protein and a PDZ ligand protein in the cell

Example 3; Page 165; 207pp; English.

The present invention describes a method (M1) for modulating a biological function of an endothelial cell or haematopoietic cell. M1 comprises carrivolucing into the cell, an agent that inhibits binding of a PDZ (PSD95, Drosephila large disc protein, and Zomula occludin 1 protein) protein and a PDZ ligand (PL) protein in the cell, and so modulates the biological function. Also described is a method (M2) for determining whether a test compound is an inhibitor of binding between a PDZ protein and a PL protein. M1 is used for modulating a biological function of an cinclial cell or haematopojotetic cell e.g., T-cell or B-cell, by an inflammatory or humoral immune response, or an autoimmune disease. An inhibitor (I) is useful for treating a disease characterised by leukocyte activation, where the disease is characterised by an inflammatory or humoral immune response, e.g., an autoimmune disease. The compounds c, PDDZ interaction inhibitors are useful for treating (ameliorating symptoms of) a variety of diseases and conditions characterised by inflammatory bowel diseases and conditions characterised by inflammatory bowel diseases, ulcerative colitis, ilettis and enteritis, inflammatory bowel diseases, ulcerative colitis, ilettis and enteritis, cardiac, kidney, lung, liver, small bowel, cornea, pancreas, cadaver, autologous, bone marrow, xenotransplantation, atherosclerosis, cancers, angiogenesis-dependent disorders, infectious diseases and ischaemia.

ABG96620 to ABG96732 and ABB6615318 represent sequences used in the exemplification of the present invention.

Novel nucleic acids and peptides derived from open reading frame X, neurodegenerative disorders and cardiovascular disease cancers, proliferative for treating

Claim 11; Page 956-957; 5507pp; English.

AAC7446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatotropic; vulnerary; antiportatic; antiportatic; antiportatic; antiportatic; antiportatic; antiportatic; antiformulant; cardiant; thrombolytic; coapulant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressive; antidiabetic; hypotensive; dermatological; immunosuppressive; antidiabetic; hypotensive; dermatological; immunosuppressive; antidiabetic; hypotensive; dermatological; immunosuppressive; antidiabetic; hypotensive; dermatological; or preventing or treating the presence of or predisposition to, or preventing or treating the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX-associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis, proliferative disorders, neurodegenerative disorders systemic lupus cythematosus, hypothyroidism, cholesterol ester storage, systemic lupus erythematosus, severe combined immunodeficiency (SCID), AlDS, viral, bacterial or fungal infection, malaria, autoimmune disorders, asthma, AAB4 0725

M1 comprises
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Modulating the biological function of an endothelial cell or hematopoietic cell e.g., a T-cell or B-cell comprises introducing into the cell, an agent that inhibits binding of a PDZ protein and a PDZ
allergies, aplastic anaemia, burns, wounds, bone and cartilage damage, nocturnal haemoglobinuria, antiinflammatory disease; to enhance coagulation; to inhibit thrombosis; and as a contraceptive.
                                                                                                                                                                     1358 KLRSTVQRSTBTGLAVENRNWMTRQASRESTDGSMNSYSSEGNLIFPGVRLASDSQPSDF

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Endothelial cell; haematopoietic cell; PDZ domain protein; PL domain protein; Bungain protein; Burngetain teukcoyte activation; synapse formation; transmembrane neurotransmitter receptor; autoimmune disease; transplantation rejection; inflammation; allergy; inflammatory Dowel disease; ulcerative colitis; listis; psoriasis; asthma; atopic dermatitis; atherosclerosis; cancer; infectious disease; ischaemia; vasulitis; Crohn's disease.
                                                                                                                                                                 The present invention relates to a new method for modulating a biological function of an endothelial cell or hematopoietic cell. The method involves introducing into a cell, an antagonist that inhibits binding between a PDZ protein and a PL protein. The inhibitor is used to treat a disease mediated by hematopoietic cells, e.g. autoimmune disease. It may also be used to prevent transplantation rejection of a solid organ transplant. The method may also be used in the treatment of inflammation, allergy, inflammatory bowel diseases, ulcerative colitis, ileitis, psoriasis asthma, atopic dermatitis, autoimmune diseases (e.g. rheumatoid arthritis, multiple soletosis, osteoarthritis, insulin-dependent diabetes, Hashimoto thyroiditis, osteoarthritis, inflammation, transplantation rejection), atherosclerosis, cancers, infectious diseases, ischemia, vasulitis and Crohn's disease.

The present invention relates to a method for modulating a biological function of an endothelial cell or haematopoietic cell, comprises introducing into a cell an antagonist that inhibits binding between a PDZ domain protein and a PL domain protein to result in inhibition of leukocyte activation. The present sequence is a PDZ domain. PDZ domains of proteins are named after three prototypical proteins. PDZ domains proteins are named after three prototypical protein. PDZ domains proteins are named after three prototypical protein. PDZ domains proteins are named after three prototypical protein. PDZ domains protein are named after three prototypical protein. PDZ domains protein are involved in synapse formation by organising transmembrane neutotransmitter receptors through intracellular interactions. The inhibitors identified by the present invention can be used to treat a disease mediated by haematopoietic cells, e.g. autoimmune diseases inflammation, allering, psoriasis, respiratory allering ciscases (e.g. rheumatoid arthritis, multiple sclerosis, insulin-dependent diabetes, Habhimoto thyroidtis, orstearthritis, atherosclerosis, cancers, infectious disease. The inhibitors can also be used to prevent transplantation rejection of a solid organ transplant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       682 RDSGAMIGLKVVGGKMTESGRLCAPITKVKKGSLAĎTVŒHLRPGDEVLEMNGRLLQGATF 741

PR PRASS and mucleic acids encoding the protein useful in diagnosing endocrine-related diseases or neuropathy and in developing process of the prevention or treatment of such diseases.

XX
XX
XX

New Rim 2 proteins and mucleic acids encoding the protein useful in diagnosing endocrine-related diseases or neuropathy and in developing process for the prevention or treatment of such diseases.

XX
XX

This sequence represents cDNA encoding mouse Rim2. Rim2 is a novel septification as Rim1), and both proteins contain a zinc finger, pre-related two c2 domains. Rim2 is able to specifically interact with cc pecification as Rim1), and both proteins contain a zinc finger, pre-related to be a requistor of Rab3-dependent intracellular vesicle is believed to be a requistor of Rab3-dependent intracellular vesicle contourine-related diseases or neuropathy and in developing agents for contourine-related diseases or neuropathy and in developing agents for the prevention or treatment of such diseases. Rim2 specific membranes, and in hormonal secretion. The Rim2 protein is useful in the diagnosing cc the prevention probes or antibodies are useful in the diagnosis of brain cc or central nervous system disorders, or for diagnosis of brain and parotid gland.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to the isolation of human polymucleotide sequences that are differentially expressed during foam cell differentiation. The polymucleotide sequences of the invention or a composition comprising these polymucleotides are useful as a high throughput method for detecting altered expression of one or more polymucleotides in a sample. The polymucleotides can be used in the diagnosis of disorders associated with foam cell development such as a theroscierosis, cerebral stroke, and cardiovascular disorders such as coronary artery disease. The polymucleotide sequences can also be used as PCR primers and probes. The polymucleotide sequences can also be used useful in gene therapy. AAS94746-AAS95021 represent the human polymucleotide sequences of the invention are also polymucleotide sequences of the invention which are differentially expressed during foam cell differentiation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Composition useful for diagnosis of conditions, disorders or diseases associated with atherosclerosis, comprises several polymucleotides that are differentially expressed in foam cell development
                                                                                                                                                                                                                                                                                                                                                                                                                                               Mikita T;

φ

The polynucleotide sequences given in AAC59966 to AAC60015 encode the human secreted proteins given in AAB34773 to AAB34822. AAB34822 tepresent human secreted polypeptide sequences and proteins homologous to them, which are given in the exemplification of the present invention. Human secreted proteins have activities based on the tissues and cells the genes are expressed in. Examples of activities include: cytostatic; immunosuppressive; nootropic; neuroprotective; antiviral;

```
antiallergic; hepatotropic; antidiabetic; antiinflammatory; antiulcer; vulnerary; anticonvulsant; antidiabetic; antifungal; antiparasitic; and cardiant. The polymuclecides and polypeptides are useful for cardiant. The polymuclecides and polypeptides are useful for preventing, treating or ameliorating a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities. The polymuclecides are useful for chromosome identification. They are also useful as probes for diagnosing a disorder related to the female reproductive system, or particularly breast and/or ovary cancer. They are also useful in the gene therapy of breast and ovarian cancer. Wucleic acids, protein, antibodies, agonists and antagonists from the present invention are useful in the diagnosis, treatment and prevention of cancer, immune disorders, cardiovascular disorders, wound healing, neurological diseases and in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         4219
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    4279
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                4100 AAAAAGCTACGGAGCACTGTTCAGAGAAGCACGGAGACCGGGGTAGCAGTGGAGATGAGG 4159

The polymucleotide, which is a secreted EST, and the encoded protein are predicted to have useful biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, immune actimilating or suppressing activity, hammacocatic/chemokinetic activity, activin/inhibin activity, chemokinetic activity, hammostatic and thrombolytic activity, receptor/ligand activity, hammostatic and thrombolytic activity, receptor/ligand activity, anti-inflammatory activity, cadherin/tumour invasion suppressor activity, tumour inhibition activity, activity, the polymucleotide may also be useful for gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New polynucleotides encoding human secreted proteins - derived from e.g. human blood, kidney, foetal lung, placenta, testes, brain, ovary, pituitary, retina and colon cDNA libraries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        4.2%; Score 207.6; DB 20; Length 355; 90.2%; Pred.
